AMENDMENT TO THE CLAIMS

Please amend claims as follows:

1-42. (Canceled)

- 43. (New) A liquid crystal display comprising:
- a first panel including a conductive member including a light transmitting portion;
- a second panel spaced apart from the first panel by a predetermined gap and including a black matrix;
- a sealant disposed between the first panel and the second panel and overlapping the black matrix, the light transmitting portion disposed at the overlapping;
- a liquid crystal layer filled in the gap between the first panel and the second panel, and enclosed by the sealant;
 - a gate driving circuit sending signals to the first panel; and
 - a data driving circuit sending signals to the first panel,
- wherein the conductive member comprises a connector for signal transmission between the data driving circuit and the gate driving circuit.
- 44. (New) The liquid crystal display of claim 43, wherein the light transmitting portion includes at least one transparent area and at least one opaque area.
- 45. (New) The liquid crystal display of claim 44, wherein the at least transparent area is an opening type.
- 46. (New) The liquid crystal display of claim 45, wherein the at least transparent area includes a plurality of slits or a lattice pattern.
- 47. (New) The liquid crystal display of claim 44, wherein the at least transparent area comprises a transparent conductive material.

- 48. (New) The liquid crystal display of claim 44, wherein the at least transparent area occupies about 20 % or more of an area occupied by the light transmitting portion.
- 49. (New) The liquid crystal display of claim 43, wherein the first panel further comprises a plurality of pixel electrodes and a plurality of storage electrode lines overlapping the pixel electrodes, and the conductive member comprises a storage electrode connection connected to the storage electrode lines and overlapping the sealant and the black matrix.
- 50. (New) The liquid crystal display of claim 43, wherein the second panel further comprises a common electrode, and the conductive member comprises a common electrode connected to the common electrode and overlapping the sealant and the black matrix.
- 51. (New) The liquid crystal display of claim 43, wherein the first panel further comprises a plurality of thin film transistors controlled by the gate driving circuit and the conductive member comprises a signal line for signal transmission with the gate driving circuit and overlapping the sealant and the black matrix.
- 52. (New) The liquid crystal display of claim 43, wherein the first panel further comprises a plurality of pixel electrodes supplied with voltages from the data driving circuit and the conductive member comprises a signal line for signal transmission with the data driving circuit and overlapping the sealant and the black matrix.
- 53. (New) The liquid crystal display of claim 43, wherein the gate driving circuit is mounted on the first panel, the data driving circuit is formed on a data PCB and the data PCB is connected to the first panel, and the conductive member further comprises a first signal line for signal transmission with the gate driving circuit.

- 54. (New) The liquid crystal display of claim 53, wherein the conductive member further comprises a second signal line for signal transmission with the data driving circuit.
- 55. (New) The liquid crystal display of claim 43, wherein the second panel comprises a common electrode and the conductive member comprises a common electrode connection connected to the common electrode and located out of the sealant.

56. (New) A liquid crystal display comprising:

a first panel including a conductive member including a light transmitting portion;

a second panel spaced apart from the first panel by a predetermined gap and including a black matrix;

a sealant disposed between the first panel and the second panel and overlapping the black matrix, the light transmitting portion disposed at the overlapping;

a liquid crystal layer filled in the gap between the first panel and the second panel, and enclosed by the sealant; and

a gate PCB and a data PCB for supplying signals to the first and the second panels,

wherein the conductive member comprises a connector transmitting signals between the data PCB and the gate PCB and overlapping the sealant and the black matrix.

57. (New) A liquid crystal display comprising:

a first panel including a conductive member including a light transmitting portion;

a second panel spaced apart from the first panel by a predetermined gap and including a black matrix;

a sealant disposed between the first panel and the second panel and overlapping the black matrix, the light transmitting portion disposed at the overlapping; a liquid crystal layer filled in the gap between the first panel and the second panel, and enclosed by the sealant;

a data driving circuit for generating data voltages;

a gate driving circuit for generating gate signals; and

a data PCB and a gate PCB for controlling the data driving circuit and the gate driving circuit,

wherein the first panel further comprises a plurality of pixel electrodes and a plurality of thin film transistors for transmitting the data voltages to the pixel electrodes in response to the gate signals, the conductive member comprises a connector for signal transmission between the data PCB and the gate PCB, a first signal line for signal transmission with the gate driving circuit, and a second signal line for signal transmission with the data driving circuit, and the connector and the first and the second signal lines are located out of the sealant.

58. (New) A method of manufacturing a liquid crystal display, the method comprising:

forming a conductive member including a light transmissive portion on a first substrate;

forming a black matrix on a second substrate;

forming a sealant overlapping the light transmissive portion;

forming a liquid crystal layer enclosed by the sealant;

adhering the second substrate to the first substrate using the sealant; and

hardening the sealant to combine the first substrate and the second substrate,

wherein the conductive member comprises a connector for signal transmission between a data driving circuit and a gate driving circuit.

- 59. (New) The method of claim 58, wherein the sealant overlaps the black matrix in part.
 - 60. (New) The method of claim 59, wherein the hardening comprises:

disposing a reflector located opposite the second substrate with respect to the first substrate; and

directing light from the second substrate to the sealant to be hardened.

- 61. (New) The method of claim 60, wherein the light is obliquely directed to the first and the second substrates.
- 62. (New) The method of claim 59, wherein the hardening comprises: directing light from the first and the second substrates to the sealant to be hardened.
- 63. (New) The method of claim 59, wherein the hardening comprises: directing light from the first substrate to the sealant to be hardened.
- 64. (New) The method of claim 63, wherein the hardening further comprises: reversing relative positions of the first and the second substrates before the direction of light.
 - 65. (New) A liquid crystal display comprising:
 - a first panel including a conductive layer;
- a second panel spaced apart from the first panel by a predetermined gap and including a black matrix;
- a sealant disposed between the first panel and the second panel and overlapping the black matrix; and
- a liquid crystal layer filled in the gap between the first panel and the second panel and enclosed by the sealant,

wherein the conductive layer has a plurality of slits located at the overlapping and elongated along a signal transmission of the conductive layer, and the conductive layer comprises a connector for signal transmission between a data driving circuit and a gate driving circuit.

- 66. (New) The liquid crystal display of claim 65, wherein the conductive layer extends along the signal transmission.
- 67. (New) The liquid crystal display of claim 66, wherein the slits form at least two rows along the signal transmission.
- 68. (New) The liquid crystal display of claim 67, wherein width of the slits is equal to or larger than distance between the slits.
